

Access Control and Privacy Settings

Access Control

Roles

There are two roles in the Ticketing Application, a description is included below:

Admin

- Admins have access to all collections, and all ticket events.
- Only Admins can update the privacy settings of a collection
- Only Admins can update the companies (business units) associated with a user

Ticketer

- Ticketers are granted access to collections based on the companies (business units) that are associated with their profile.

Privacy Settings

A collection's privacy settings will dictate which users can add a ticket event to a collection or edit it.

Below is a description of who can view a ticket event based on privacy settings for the collection it belongs to:

Private Collections

- Only the ticketer who created this collection and admins can view, edit and report on the ticket events that belong to this collection
- Ticket events that belong to a private collection cannot be added to another collection
- Only an admin can make a collection private
- If a collection is made private, but contains ticket events that are already present in other collections the ticket events will be removed from all other collections

Touring Collections

- Only users within the company to which this collection belongs too will be able to edit ticket events that belong to this type of collection
- Ticket events in this collection can be added to other collections for reporting purposes, but users will not be able to edit them
- Only an admin can set a collection to "Touring"

- If a collection is switched from Public to Touring, but contains ticket events that are already present in other collections the ticket events will still be viewable in all collections but will only be editable by the business unit associated with the collection

Public Collections

- Ticket events added to public collections can also be added to collections of users from different business units.

Ticketing Companies (touring groups and regions)

- Confirm with Product Council
- Confirm table aeg.NewElvis_Companies is correct, with `company_type_id == 2,4`

Related Stories

Stories for Privacy Refactor (including Touring Privacy Setting)

Ticket event can be added to more than one collection

- UX for collections when ticket event is switched from public to private
- UX for collections when ticket event is switched from public to touring
- UX for collections when ticket event is switched from touring to private

As an Admin, I would like to set a collections privacy policy to private

Acceptance Criteria

- If a collection Privacy Policy is updated from **Touring** or **Public** to **Private**, but contains ticket events that are already present in other collections the ticket events will be removed from all other collections
- <https://kunaiconsulting.atlassian.net/browse/TA-689>

As an Admin, I would like to set a collections privacy policy to touring

Acceptance Criteria

- If a collection Privacy Policy is updated from **Public** to **Touring**, but contains ticket events that are already present in other collections the ticket events will still be viewable in all collections but will only be editable by users who have the company of the touring collection associated with their profile
- If a collection Privacy Policy is updated from **Private** to **Touring**, ticket events in this collection should now be displayed in the “Add Ticket Event” to collection modal
- If a ticket event belongs to a collection that is set to touring, it can be added to other collections
 - Only users with the company associated with the touring collection that the ticket event belongs to will be able to edit the ticket event after it has been added to a collection

As an Admin, I would like to set a collections privacy policy to public

Acceptance Criteria

- If a collection Privacy Policy is updated from **Touring** to **Public**, display this event on the “Add Ticket Event” to collection modal
- If a collection Privacy Policy is updated from **Private** to **Public**, display this event on the “Add Ticket Event” to collection modal

Adding Ticket Event to Collection Modal Improvements

- Subtask 1: Ticket Event can belong to multiple collections
 - A ticket event should be able to be added to multiple collections
- Subtask 2: Ticket Events to display in modal
 - The only ticket events that should not be displayed in the “Add Ticket Event” modal are ticket events that belong to a collection that is set to private
 - A ticket event should not be displayed in the modal if it has already been added to the collection (can’t have duplicates of a given ticket event in a collection)

Ticket Event Detailed view

- If a ticket event belongs to a touring collection the company associated with the touring collection should be displayed in the header (bijan to get design)
- If the user has the company associated with the touring collection associated with their profile they should be able to edit the ticket event
- If the user doesn’t have the company associated with the touring collection associated with their profile they should not be able to edit the ticket event
 - Replace the “Edit” button with a Lock symbol and include a tooltip that notifies the user they cannot edit the event because the ticket event belongs to a touring collection and the company that owns this collection is not associated with the user profile
 - Schedule meeting with Steve to discuss design and UX

Ticket Events that should be displayed on reporting page

- Because a ticket event can exist in multiple collections we do n
